# Aerosols and Climate

- **Direct and indirect effects on the Earth's energy balance**
- Scattering ( $\sigma_{sp}$ ) and absorption of solar radiation and the number of cloud condensation nuclei will be affected by aerosol concentration, size and chemical composition

Aerosol Particle

Relative Humidity

## HYGROSCOPICITY:

Since aerosol particles can take up water, they can change in size and chemical composition depending on the ambient relative humidity (RH)

$\sigma_{sp}(RH, \lambda)$ , strongly depends on RH

## SCATTERING ENHANCEMENT FACTOR

$$f(RH, \lambda) = \frac{\sigma_{sp}(RH_{wet}, \lambda)}{\sigma_{sp}(RH_{dry}, \lambda)}$$

Scattering coefficient at elevated RH

Dry scattering coefficient

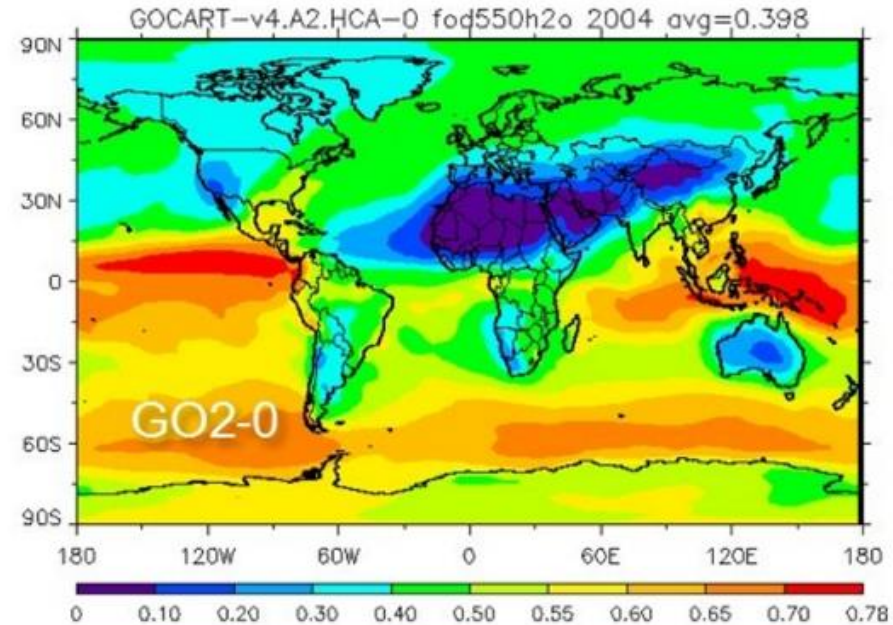

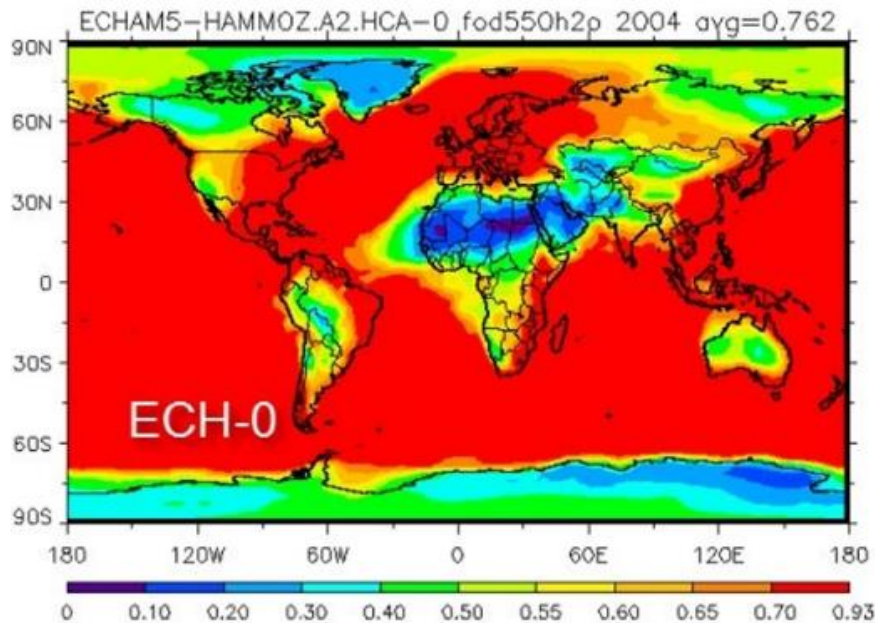

The effect of water uptake is **relevant** for **climate forcing calculations** as well as for the comparison or validation of **remote sensing** with in-situ measurements and for the improvement of **Global Climate Models**

How well do  
**Global Climate Models**  
represent aerosol optical  
**hygroscopic growth?**

## Hygroscopicity in GCM's

Fraction of aerosol optical depth (AOD) due to **water** in different models:

*Figures from Mian Chin (NASA Goddard)*

ECHAM5: global annual average **76%**

GOCART: global annual average **40%**

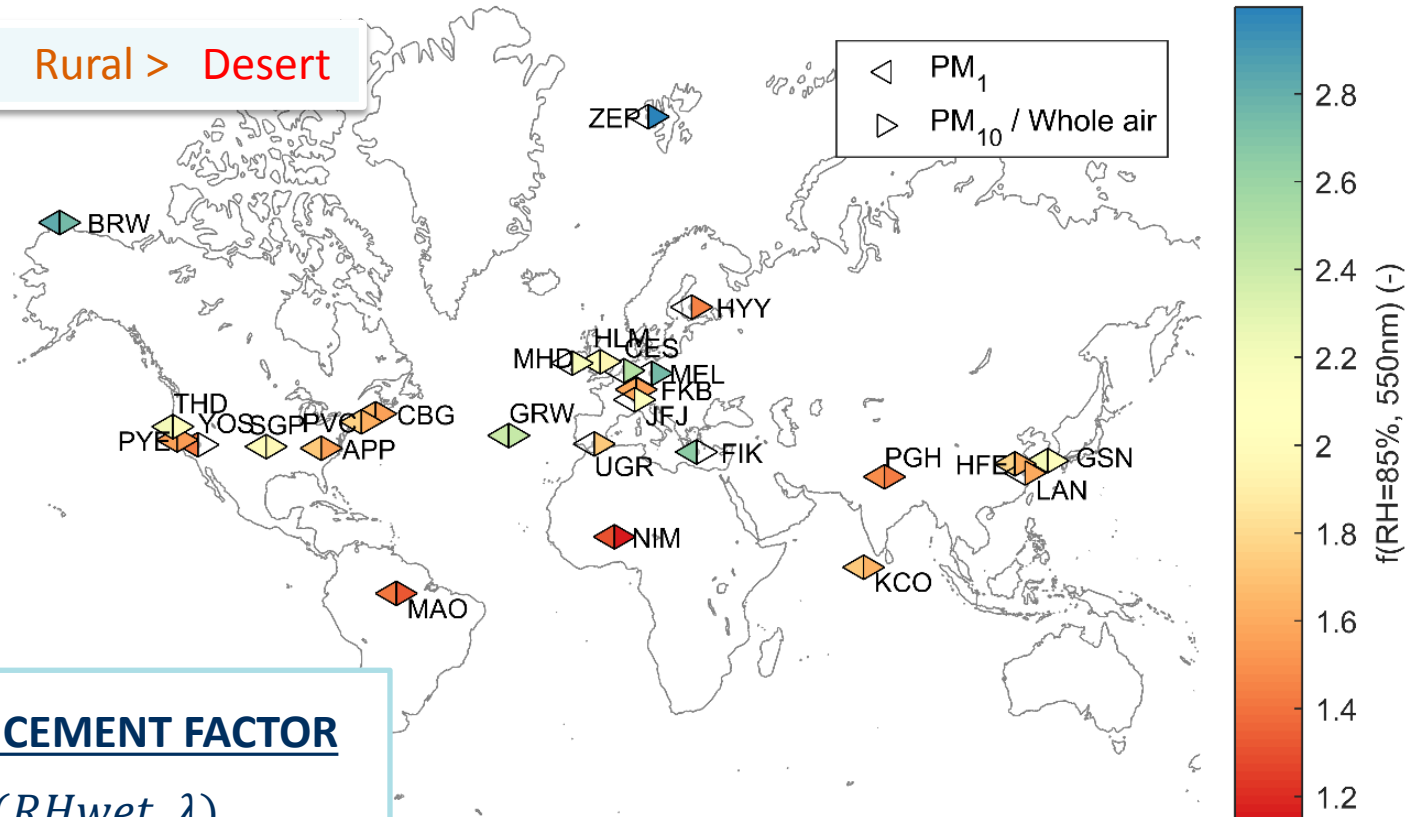

# A global view on the effect of water uptake on aerosol particle light scattering

SCIENTIFIC DATA 

Arctic > Marine > Rural > Desert

## SCATTERING ENHANCEMENT FACTOR

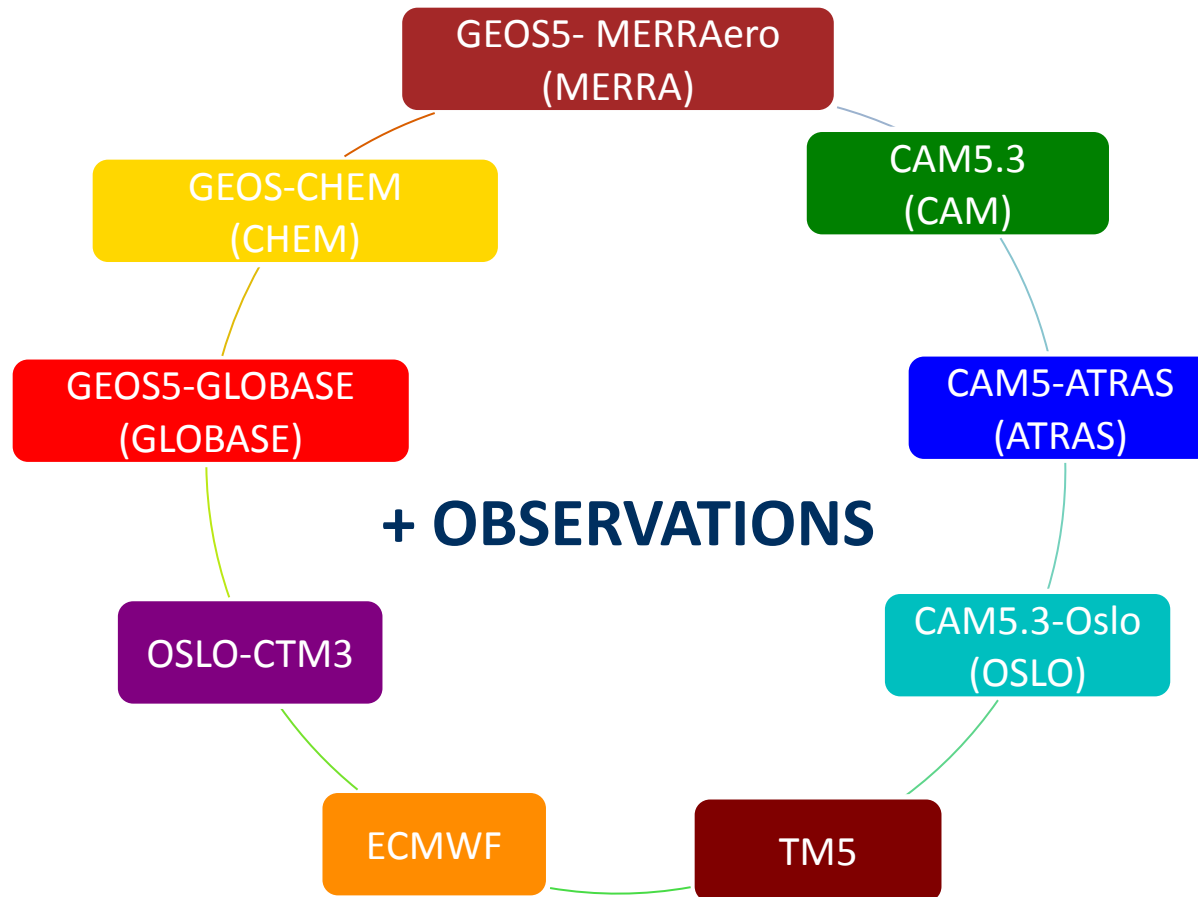

$$f(RH, \lambda) = \frac{\sigma_{sp}(RH_{wet}, \lambda)}{\sigma_{sp}(RH_{dry}, \lambda)}$$

**We encourage you to provide model data!!**

**Data call: Common AeroCom phase III Diagnostics Request 2019**

<https://wiki.met.no/aerocom/phase3-experiments>

INSITU project within AeroCom Phase III:

- Aerosol optical data at **RH=0, 40 and 85%**
- **Hourly values for 2010** (time coverage not always coincident with measurements). Daily for Oslo-CTM2 (preliminary).
- Various locations -> **20 coincident sites** with observational data
- **Uncertainty** in measurements between 20-30%

## $f(RH=85\%, 550\text{nm})$

**Recommended dry conditions** in order to keep measurements comparable:  
RH < 30 - 40%

**WMO/GAW.** Aerosol Measurement Procedures Guidelines and Recommendations,  
Report No. 153. World Meteorological Organization, Geneva, Switzerland (2003).

$RH_{\text{dry}} = 0\%$

$RH_{\text{wet}} = 85\%$

$$f(RH, \lambda) = \frac{\sigma_{sp}(RH_{\text{wet}} = 85\%, \lambda)}{\sigma_{sp}(RH_{\text{dry}} = 0\%, \lambda)}$$

## $f(RH=85\%, 550\text{nm})$

**Recommended dry conditions** in order to keep measurements comparable:  
RH < 30 - 40%

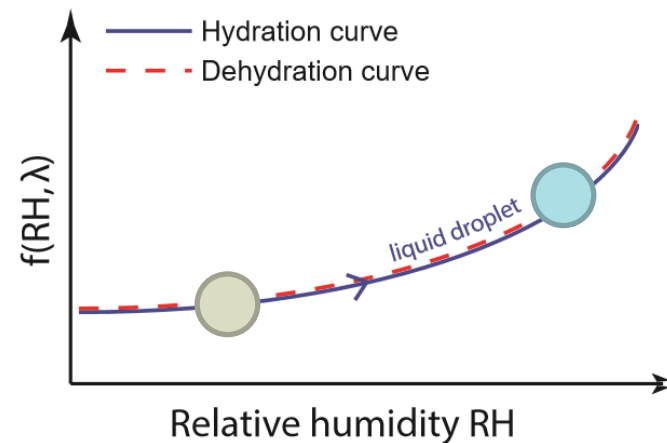

**WMO/GAW.** Aerosol Measurement Procedures Guidelines and Recommendations,  
Report No. 153. World Meteorological Organization, Geneva, Switzerland (2003).

$RH_{\text{dry}} = 0\%$

$RH_{\text{wet}} = 85\%$

Entire dataset -> seasonally collocated (but different years!)

**Warning!** Model outputs from 2010 have been compared with in-situ measurements, collocating by month, while years may be different!

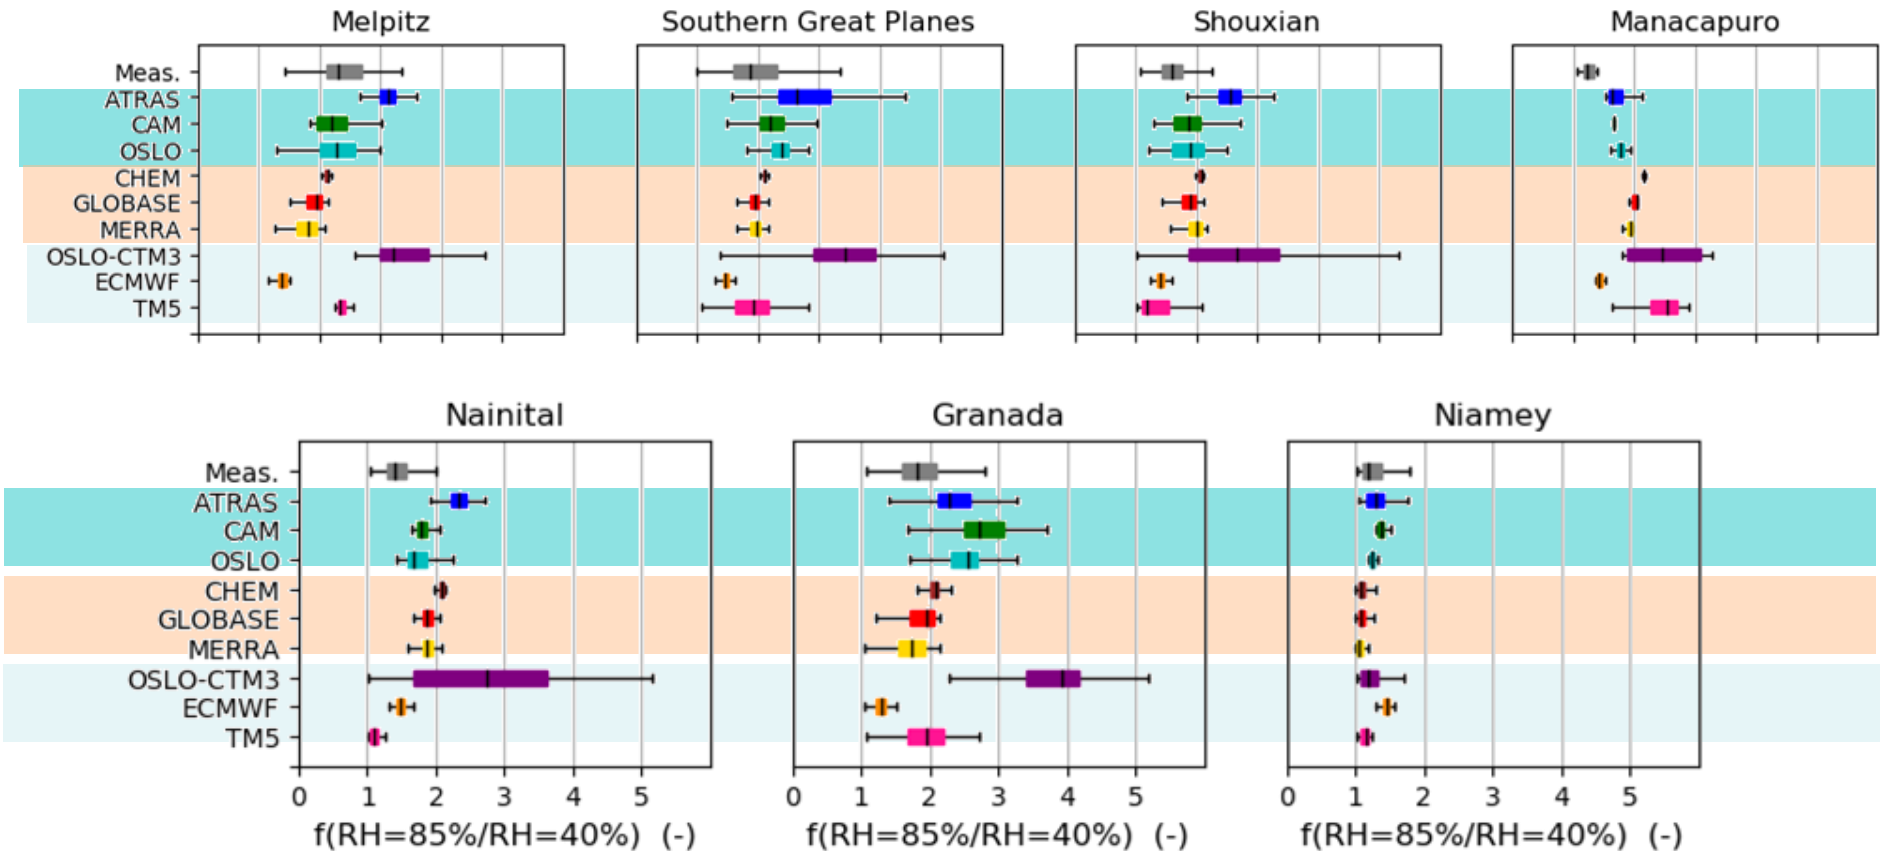

Entire dataset -> seasonally collocated (but different years!)

**Warning!** Model outputs from 2010 have been compared with in-situ measurements, collocating by month, while years may be different!

- GEOS models exhibit less variability
- CAM models tend to overestimate more than GEOS models at Arctic, marine and rural sites

## Entire dataset -&gt; seasonally collocated (but different years!)

- Oslo-CTM2 stands out due to its variability -> PRELIMINARY! daily values
- ECMWF is the model that underestimates more sites
- TM5 model exhibits the best agreement at all site types

## Different representation of

- **Aerosols**: aerosol size distribution, mixing state, attachment state, composition, and internal structure
- **Processes**: primary emissions, new particle formation, coagulation, water uptake, and activation to form cloud droplets

### CAM-models

Model	Hygroscopicity	Mixing State	Size distribution
<b>CAM5.3</b> Liu et al. 2012, GMD	Köhler theory (Table S3: e.g. 1.16 for sea salt)	Internal and external mixing	Aitken, accumulation and coarse
<b>CAM5-ATRAS</b> Matsui et al. 2011, JGR	Köhler theory (1.16 for Na and Cl)	Multiple mixing states for each size bin	128 aerosol bins
<b>CAM5.3-Oslo</b> Kirkevåg et al. 2018, GMD	Köhler theory (growth factor $\sim 2$ for RH=80%, sea salt)	Internal and external mixing	44 size-bins with radii (r) ranging from 0.001 to 20 $\mu\text{m}$

## Different representation of

- **Aerosols**: aerosol size distribution, mixing state, attachment state, composition, and internal structure
- **Processes**: primary emissions, new particle formation, coagulation, water uptake, and activation to form cloud droplets

### GEOS-models

Model	Hygroscopicity	Mixing State	Size distribution
<b>GEOS5-Globase</b> Chin et al. 2002, AMS	(growth factor of 2 at RH=80% for sea salt)	External mixing	Sulfate, BC and OC (2 bins each), dust and sea salt (5 bins each)
<b>GEOS-Chem</b> Bey et al. 2001, JGR	Table 1, Martin et al., 2003, JGR (growth factor of 2 at RH=80% for sea salt)	External mixing	Sulfate-nitrate-ammonium, OC, BC (bulk-mass approach) Dust (4 bins), sea salts (2 bins)
<b>GEOS5-MERRAero</b> Buchard et al. 2015, ACP	OPAC and Tang et al., 1997	External mixing	OC and BC (2 bins), sulfate, dust (5 bins), sea salt (5 bins)

- I. The **new benchmark dataset** of RH-dependent particle light scattering coefficients and scattering enhancement factors  $f(\text{RH})$  has been finalized and successfully tested against nine GCM's
- II. Models generally **overestimate**  $f(\text{RH})$  but comparison **improves** if  $\text{RH}_{\text{dry}}=40\%$  is taken as reference RH
- III. Models show a **large diversity** in  $f(\text{RH})$  with respect to magnitude and temporal evolution (e.g. seasons)
- IV. Reasons are manifold: differences in model parametrizations of e.g. hygroscopicity, size, sources + strength, mixing state, removal processes, etc.

Thanks for your attention

Stockholm  
University

## Model vs Measurements: relative difference

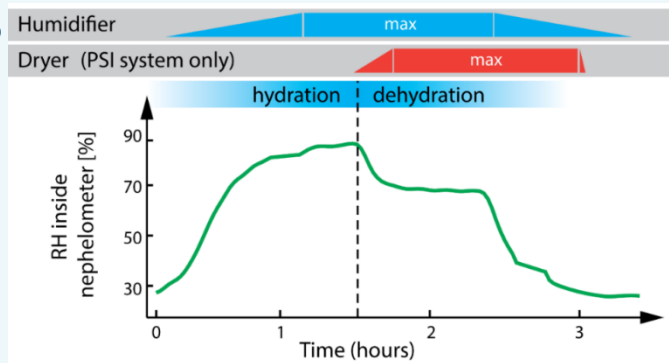

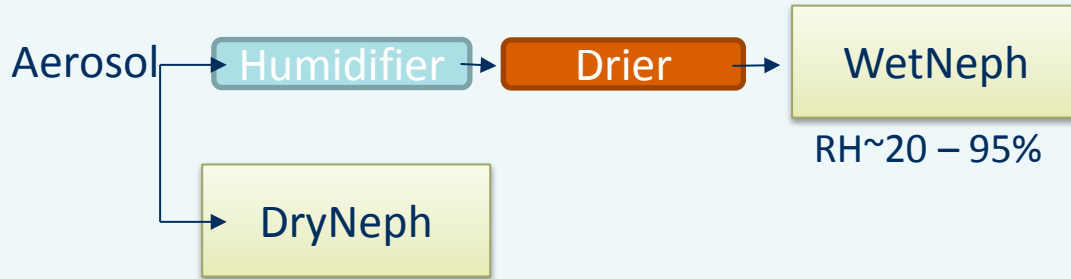

- **Large differences (25% - 75%)** between models and measurements
- Largest differences found for **Rural and Urban** sites for all models
- Models perform better at **Arctic and Desert** sites

# Tandem Humidified Nephelometer

## PSI system:

(Fierz-Schmidehauser et al., 2010)

## NOAA system:

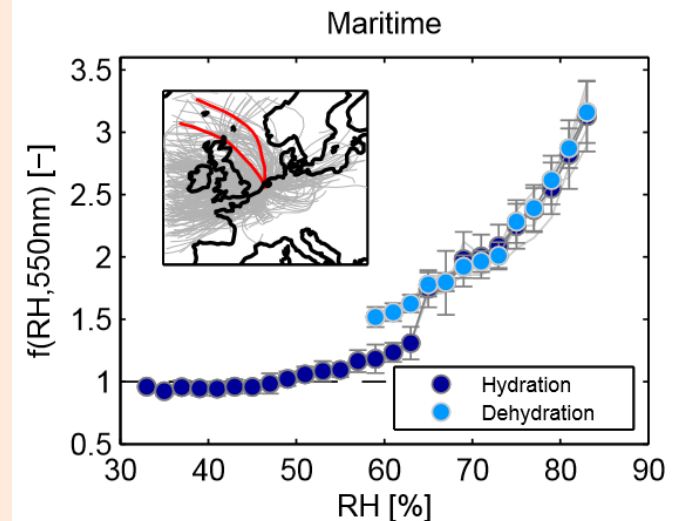

Humidograms can be **parameterized**:

$$f(RH) = \alpha (1 - RH)^{-\gamma}$$

*Carrico et al., 2003*

**Problem** for sea salt aerosols  
(deliquescence)

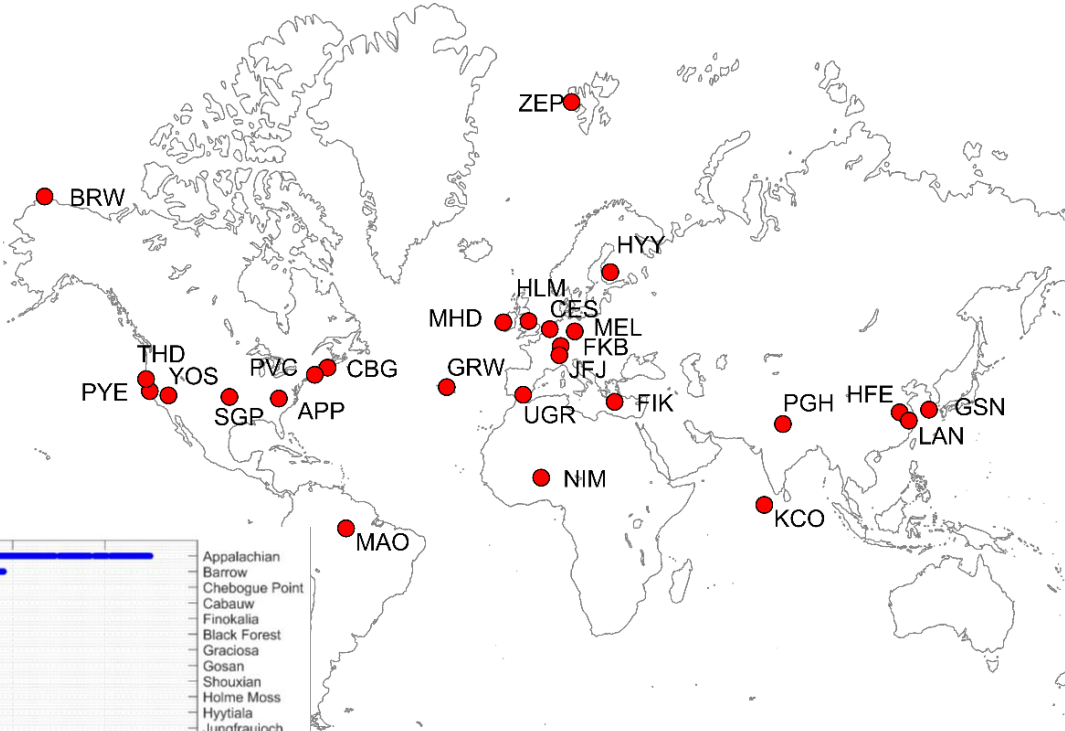

*Zieger et al., 2011*

- **Fit separately** for RH>75% or RH<65% (*Zieger et al., 2010*)
- Several **equations** (*Titos et al., 2016*)

DoE project:  
 “Evaluation and improvement of the parameterization of aerosol hygroscopicity in global climate models using in-situ surface measurements” (2016-2019)

**HARMONIZED DATA SET**

- covering 18 years  
 compare with GCM's

# Checking the time series of BRW for the measurements
